

Customer Behaviour Analysis Dashboard (Excel Project)

Project Overview

“My goal was to build an interactive Excel dashboard that would provide a clear, data-driven view of customer behaviour and help stakeholders make better decisions around marketing, sales, and operations.”

Action

“I started by **cleaning and preparing the dataset in Excel**—handling missing values, standardizing categories, and removing duplicates to ensure data accuracy.

Then I built the dashboard using:

- **Pivot Tables and Pivot Charts** for aggregations
- **Slicers** for interactivity (month, category, channel)
- Calculated key metrics like:
 - Total Sales
 - Total Orders
 - Average Order Value (AOV)

I also created derived fields like **age groups** to segment customers into Teenagers, Adults, and Seniors.

From there, I designed visualizations to answer key business questions:

- Sales vs Orders trend
- Gender-based contribution
- Channel performance
- Top-performing states

- Order status distribution”

Tools & Skills Used

- Microsoft Excel
- Pivot Tables & Pivot Charts
- Slicers (Interactive Filters)
- Data Cleaning (TRIM, IF, IFERROR)
- Basic KPI Calculations

Dataset Description

The dataset includes:

Column Name	Description
-------------	-------------

Order ID	Unique order identifier
----------	-------------------------

Amount	Sales value
--------	-------------

Gender	Customer gender
--------	-----------------

Age	Customer age
-----	--------------

State	Customer location
-------	-------------------

Category	Product category
----------	------------------

Channel	Sales platform
---------	----------------

Order Status	Delivered/Returned/Cancelled
--------------	------------------------------

Key Features of Dashboard

➤ Interactive Filters

- Month
- Category
- Channel

➤ KPI Metrics

- Total Sales
- Total Orders
- Average Order Value (AOV)

➤ Visualizations

- Orders vs Sales (Bar Chart)
- Sales by Gender (Pie Chart)
- Order Status Distribution
- Top 5 States by Sales
- Orders by Age & Gender
- Sales by Channel

Excel Formulas Used

Total Sales = `SUM(Amount)`

Total Order = `COUNTA(OrderID)`

Average Order Value (AOV) = `Total_Sales / Total_Orders`

Age Group Classification =

`IF(Age<20, "Teenager", IF(Age<60, "Adult", "Senior"))`

Conclusion

“I built an Excel dashboard that identified women as the primary revenue drivers (61%) and Amazon as the top channel (35%), enabling targeted marketing and data-driven business decisions.”
